Fortis Integrated Command and Control

Covering every sensor and control point

Fortis is a fully integrated system that supports decision making and wide-area command and control in real time.

The system creates a unified and interactive intelligence picture - drawing data from all sensors, showing the displacement of ground forces and adding other relevant information such as video from different sources, auxiliary services and weather conditions.

This combined picture, constantly updated, is sent by Central Command to all forces in the command chain and serves as a uniform basis for operational planning and allocation of tasks.

Fortis is characterized by four key attributes:

Connectivity

Fortis integrates sensors of every type (electronic fences, video cameras, radars, VMDs) within one unified view and manages the bi-directional transfer of data between them. From a central workstation, the operator can rapidly display, control and direct individual sensors, significantly increasing their effectiveness.

All field communications are undertaken via Wireless LAN. This gives command vehicles and foot patrols, operating within the coverage area, great freedom of movement as well as flexibility. Using Wireless LAN, the system transfers any type of message to the field - whether this is live video feed, data, GPS information or VoIP.

Versatility

Fortis is designed for maximum effectiveness in a multi-level and multi-tasking environment. It delivers a wide range of security information - live video, 3D images, battle scenarios, annotated maps and sensor information. It contains powerful tools for field analysis, showing line-of-sight, vantage points and blind spot elements. Moreover, Fortis is highly effective at every operational level - in control rooms, command vehicles and on foot patrols.

Modularity

Fortis is a highly modular system that can be adapted to any security scenario. It allows a broad range of system parameters to be specified - such as types of sensors, types of cameras, Wireless LAN coverage area, or numbers of mobile control units in the field. This ensures that each Fortis system can be uniquely arranged to best serve specific needs and deliver maximum results.

Redundancy

Fortis preserves high survivability and redundancy in any field condition, weather and operational set-up situation. This redundancy is achieved by using parallel and independent communication systems.
